5/5 answered

Q5 Prime Number Checker10 marks

Write pseudocode for a program that accepts an integer from the user and determines whether it is a prime number. The pseudocode should include a loop that checks divisibility from 2 up to the square root of the number (or up to n-1), and should clearly state the decision logic used to conclude whether the number is prime or not.

Key Elements Expected: input step, loop with divisibility check, boolean/flag tracking, final decision output.

Your Answer

```
input n
if n <= 1 then
    output "not prime"
else
    isprime = true
    i = 2
```

Q1 Factorial Calculation 10 marks

Write pseudocode for a program that accepts a non-negative integer n from the user and calculates its factorial (n!) using an iterative loop (not recursion). Clearly show the initialization of the result variable, the loop structure, and the final output step.  
  
Key Elements Expected: variable initialization, loop from 1 to n, running product update, output step.

Your Answer

```
class factorial
declare int n
declare long result
declare int i
read n
result = 1
```
